LATEST STATISTICS FROM STATISTICS NEW ZEALAND

Embargoed until 10:45am – 21 December 2006

Gross Domestic Product

September 2006 quarter

Highlights

- **Economic activity increased 0.3 percent** in the September 2006 quarter, following an increase of 0.4 percent in the June 2006 quarter.
- **Annual growth in gross domestic product was 1.4 percent** for the September 2006 year.
- **Service industries were up 0.9 percent** this quarter, following an increase of 0.7 percent in the June 2006 quarter.
- **Domestic spending decreased by 0.2 percent** this quarter, resulting in annual growth of 0.4 percent.
- **Household consumption expenditure increased by 0.2 percent** this quarter, following a decrease of 0.5 percent in the June 2006 quarter.
- **Real gross national disposable income decreased 0.1 percent** in the September 2006 year.

Quarterly Change in Gross Domestic Product

Seasonally adjusted chain-volume series expressed in 1995/96 prices

Cathryn Ashley-Jones
Acting Government Statistician

21 December 2006
Cat 51.902 Set 06/07 – 099

There is a companion Media Release published – [Gross Domestic Product: September 2006 quarter](#).

Commentary

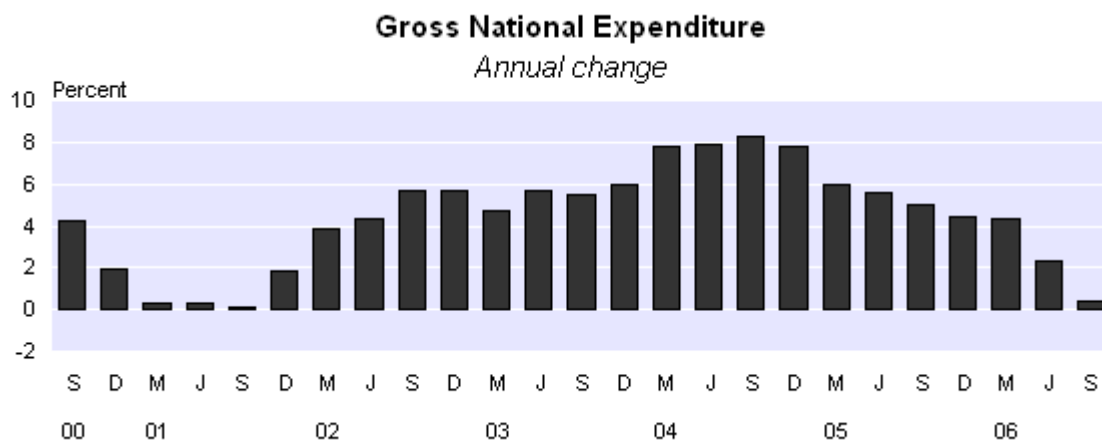

Components of the production measure of gross domestic product (GDP) have been revised, due to the incorporation of annual current price industry value-added statistics, as released on 20 July 2006. In addition, expenditure measure estimates have been revised, due to the incorporation of annual current price expenditure data released on 16 November 2006. For further information refer to the "Revisions this quarter" section in the Technical notes of this release.

All references to quarterly movements are to seasonally adjusted chain-volume series expressed in 1995/96 prices unless otherwise stated.

Domestic demand falls in the September 2006 quarter

Economic activity increased 0.3 percent in the September 2006 quarter, following an increase of 0.4 percent in the June 2006 quarter. In the year ended September 2006, the economy grew 1.4 percent, down from the 2.5 percent growth recorded in the year ended September 2005.

Total domestic spending, as measured by gross national expenditure (GNE), fell 0.2 percent this quarter, primarily as a result of reduced investment in inventories (down \$363 million) and a 13.6 percent reduction in non-residential building investment. Domestic spending has fallen in three of the last four quarters, resulting in annual growth reaching a five-year low of 0.4 percent. The graph below shows annual movements in the actual chain-volume measure of GNE.

Service industries continued to provide much of the impetus in the New Zealand economy, increasing 0.9 percent in the September 2006 quarter. The finance, insurance and business services group, together with the transport and storage, and communication industries, contributed strongly to this quarter's growth.

Offsetting the continued growth in service industries was a 1.0 percent fall in manufacturing activity in the September 2006 quarter. Sales growth in manufacturing industries in the September 2006 quarter was sourced from a run-down in finished goods inventories, meaning that production actually declined in the quarter. On an annual basis, manufacturing activity fell 1.5 percent, with declines recorded in all sub-industries except food, beverage and tobacco manufacturing, which rose 2.6 percent in the year ended September 2006. Activity in the construction industry also fell this quarter, driven primarily by a reduction in non-residential building activity.

The graph below shows annual movements in the actual chain-volume measures of GDP for the three industry groupings: primary industries, goods-producing industries and service industries.

The expenditure-based measure of GDP, released concurrently with the production-based measure, recorded a 0.6 percent increase in the September 2006 quarter. This was driven by a continued improvement in the net trade balance, with exports increasing 3.3 percent and imports increasing 1.4 percent.

Real gross national disposable income (RGNDI), which is a measure of the volume of goods and services that New Zealand residents have command over, decreased 0.1 percent for the year ended September 2006. GDP increased 1.4 percent over the same period.

Expenditure on gross domestic product

Households

Household spending increased 0.2 percent in the September 2006 quarter, following last quarter's 0.5 percent decrease. Household spending was up 2.5 percent for the year ended September 2006, down from the 5.2 percent growth recorded in the year ended September 2005.

Annual growth in private final consumption expenditure was 2.5 percent for the year ended September 2006. This is the lowest annual growth in private final consumption expenditure since the year ended December 2001.

Expenditure on non-durables remained flat in the September 2006 quarter. Expenditure on durables and services increased 0.8 percent and 0.3 percent, respectively, in the September 2006 quarter. Major contributors to the increased expenditure on durables were retail furniture and major appliances (up 3.0 percent) and recreational goods (up 2.5 percent), while expenditure on new vehicles was up 13.6 percent, following a 13.1 percent fall in the June 2006 quarter.

The modest increase in expenditure on services was spread across most categories of services, with upward contributions coming from expenditure on recreation, restaurants and takeaway foods. Offsetting these increases was a 5.0 percent decline in expenditure on overseas travel.

Business investment

Business investment in fixed assets rose 2.2 percent this quarter, following a decrease of 6.0 percent in the June 2006 quarter. On an annual basis, business investment for the year ended September 2006 increased 0.9 percent.

A 31.0 percent increase (\$258 million) in transport equipment investment (coming mainly from new investment in aircraft) drove the increase in business investment this quarter. An offsetting decrease came from a 13.6 percent decline in non-residential building investment, in part due to work on building new prisons tapering off.

The September 2006 quarter has seen a \$330 million run-down in inventories, following a \$33 million build-up in the June 2006 quarter. Manufacturing inventories fell \$436 million this quarter, with seven of the nine industry groupings showing inventory run-downs, the largest being seen in a \$243 million decline in food, beverage and tobacco product inventories.

Distribution inventories were up slightly this quarter, following a strong build-up in the June 2006 quarter. Other wholesale inventories provided the largest contribution to the \$158 million reduction in investment in distribution inventories, mainly as a result of reduced investment in motor vehicle inventories.

Government

General government expenditure increased 0.9 percent in the September 2006 quarter, and was up 4.1 percent for the year ended September 2006. Central and local government expenditure increased this quarter, up 0.9 and 1.4 percent, respectively.

Exports and imports

A strong result from the external sector contributed to the 0.6 percent increase in expenditure on GDP, with export volumes increasing 3.3 percent and import volumes increasing 1.4 percent in the quarter.

Merchandise exports increased 4.3 percent this quarter, mostly due to a 13.5 percent increase in agriculture and fishing primary products; a 7.4 percent increase in metal products, machinery and equipment; and an 11.5 percent increase in wood and paper products. Exports of meat and dairy products also continued to increase this quarter. Offsetting decreases were recorded in export volumes for textiles, apparel and leather products, and for coal, crude petroleum, minerals and gas. On an annual basis, exports of dairy products, agriculture and fishing primary products recorded strong growth, up 11.3 percent and 2.8 percent, respectively. The increase in merchandise exports this quarter has been sourced primarily from inventories.

Exports of services decreased 1.3 percent in the September 2006 quarter, due to flat tourist expenditure and a decline in student and business travel expenditure, as well as reduced exports of other services. For the year ended September 2006, exports of services decreased 2.7 percent.

Import volumes rose 1.4 percent in the September 2006 quarter, following a 1.3 percent decrease the previous quarter. Merchandise imports rose 2.4 percent this quarter, while services imports fell 1.5 percent.

A key contributor to the increase in imports volumes this quarter was an 11.4 percent increase in imports of capital goods, as a result of a \$234 million increase in imports of industrial transport equipment (largely attributable to imports of aircraft).

Imports of intermediate goods recorded a 5.5 percent increase in the September 2006 quarter, following a decrease of 2.7 percent in the June 2006 quarter.

Parts and accessories of capital goods provided the major contribution to the increase in imports of intermediate goods this quarter, increasing 8.9 percent. Primary fuels and lubricants also contributed to the increase, up 10.7 percent this quarter, following an 18.5 percent fall in the June 2006 quarter.

Imports of consumption goods fell 1.8 percent in the September 2006 quarter, following a 1.1 percent rise in the June 2006 quarter. In the year ended September 2006, imports of consumption goods rose 5.0 percent.

Imports of services fell 1.5 percent this quarter, following a 2.1 percent decrease in the June 2006 quarter. Miscellaneous services, travel services and government services imports were the main contributors to the decline this quarter, with an offsetting increase in royalties imports.

Gross domestic product by industry

Primary industries

Activity in primary industries increased 0.1 percent in the September 2006 quarter. Primary industries increased 1.6 percent for the year ended September 2006.

The relatively flat growth in primary industry value added is a reflection of the growth in agriculture production being largely offset by a decline in mining activity. Continuing growth in dairy farming output was the major contributor to the increase in agriculture production, while a reduction in the volume of gas extraction contributed to the decline in mining activity in the September 2006 quarter.

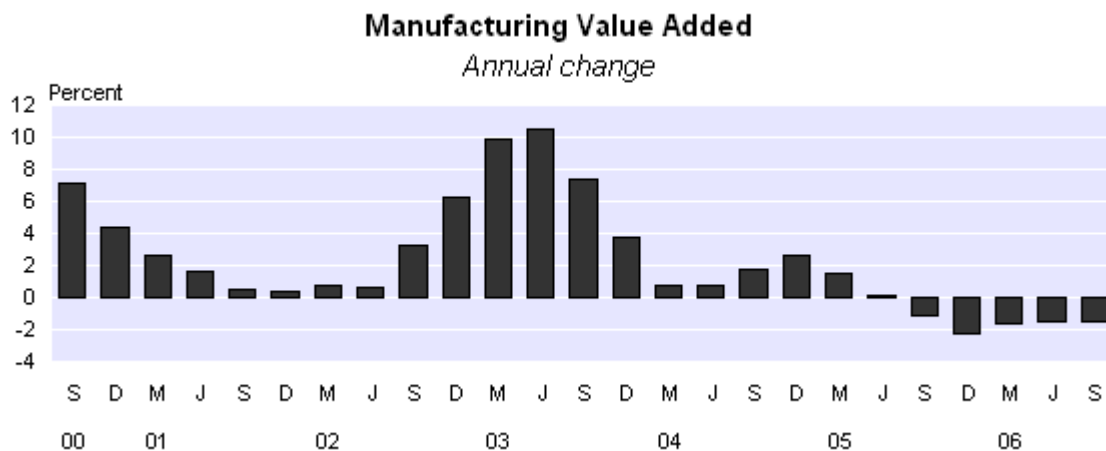

Goods-producing industries

Activity in goods-producing industries decreased 1.1 percent in the September 2006 quarter, following a 1.1 percent decrease in the June 2006 quarter. Goods-producing industries decreased 1.5 percent for the year ended September 2006.

As a consequence of balanced annual current price value added for the year ended March 2002, final information is now available regarding the contribution of the Dairy Board to total wholesale trade in the year ended March 2002. This information has been used to update the value added that has been transferred from the wholesale trade industry to the food, beverage and tobacco product manufacturing industry (where that activity now resides), starting from the September 2002 quarter. This has resulted in revisions to both the levels and growth rates for these two industries from the September 2002 quarter.

Eight of the nine manufacturing industries recorded decreases in the year ended September 2006, with the food, beverage and tobacco manufacturing industry being the only exception (up 2.6 percent).

Overall manufacturing activity decreased 1.0 percent in the September 2006 quarter, following a 0.3 percent decrease in the June 2006 quarter. Food, beverage and tobacco product manufacturing activity decreased 2.7 percent in the September 2006 quarter, as a result of increased sales being largely sourced from finished goods inventories.

Construction activity decreased 0.8 percent in the September 2006 quarter, and was down 1.0 percent for the year ended September 2006. Non-residential building construction was the major contributor to the decrease in construction activity in the quarter, mainly as a result of work on new prisons tapering off. Residential building construction activity increased, following a decrease in the June 2006 quarter.

Service industries

Service industries have continued to provide much of the growth in the economy this quarter, increasing 0.9 percent in the September 2006 quarter and 2.6 percent in the year ended September 2006.

Activity in the finance, insurance and business services group provided the largest contribution to service industry growth, with finance and insurance increasing 1.6 percent, and property and business services increasing 1.8 percent in the September 2006 quarter. Communication services, and transport and storage also recorded strong growth, up 1.6 percent and 2.3 percent, respectively.

Retail trade activity increased 0.8 percent in the September 2006 quarter, following a flat result in the June 2006 quarter, contributing to growth of 2.3 percent for the year ended September 2006.

Government administration and defence decreased 0.6 percent in the September 2006 quarter, following 19 consecutive quarters of growth. Central government administration and defence was the major contributor to this decline, recording a 1.3 percent fall in the September 2006 quarter. However, the strong growth in previous quarters means that activity in this industry is up 6.3 percent for the year ended September 2006.

Personal and community services increased 0.4 percent in the September 2006 quarter, driven mainly by cultural and recreational services increasing 3.1 percent. Health and education provided offsetting quarterly declines of 0.7 percent and 0.2 percent, respectively.

Government Administration and Defence Value Added

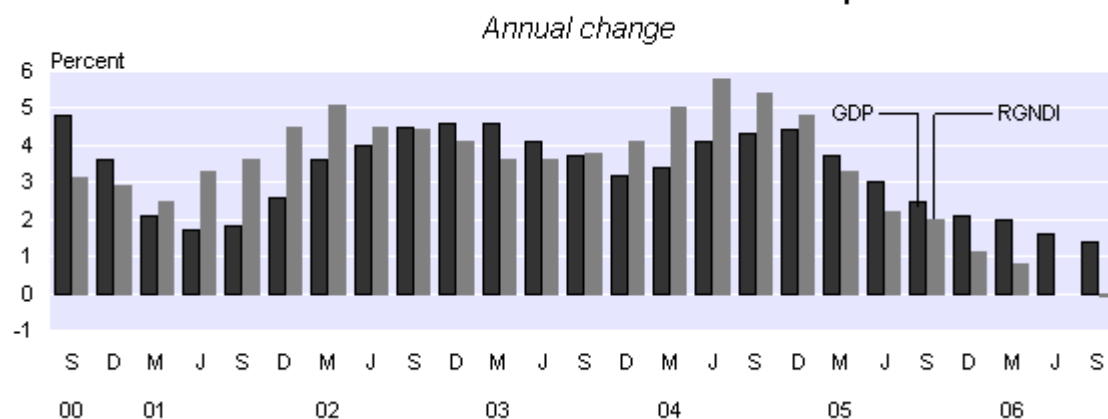

Real gross national disposable income

RGNDI decreased by 0.1 percent for the year ended September 2006, while GDP increased by 1.4 percent over the same period.

GDP is a measure of economic activity. RGNDI is a measure of the volume of goods and services that New Zealand residents have command over. It takes into account changes in the terms of trade (the price of imports relative to the price of exports), and real gains from net investment and transfer income with the rest of the world.

Gross Domestic Product and Real Gross National Disposable Income

Implicit price deflators

The GDP implicit price deflator (IPD) for the year ended September 2006 increased 2.0 percent, compared with a 3.2 percent increase for the year ended September 2005. The GDP IPD is a broad measure of the overall price change for final goods and services produced in New Zealand.

The IPD for GNE was up 3.0 percent for the year ended September 2006. This provides a broad measure of the overall price change for final goods and services purchased in New Zealand (such as consumer and investment goods).

Expenditure-based measure

Expenditure on GDP recorded a 0.6 percent increase for the September 2006 quarter. While the production- and expenditure-based measures are both official series, the production-based measure has historically shown less volatility and is the preferred series for quarter-on-quarter changes.

Revisions

Quarterly revisions for total GDP are shown in Table 1.1. See the Technical notes of this release for an explanation.

Technical notes

First available information for September 2006 quarter

Statistics in the attached tables provide the first available information on the chain-volume measure of gross domestic product (GDP) for the September 2006 quarter.

Statistics for recent periods are based on information available at 14 December 2006 and are subject to revision as additional or improved data becomes available.

Chain-volume series expressed in 1995/96 prices

The series in this release are chain-linked and expressed in the average prices of the 1995/96 year. They are best described as annually reweighted chained Laspeyres volume indexes. Series are expressed in 1995/96 dollars rather than as index numbers, since this has the advantage of showing the relative size of each component.

The chain-volume measures of GDP and expenditure on GDP are constructed by: (a) compiling a Laspeyres volume index of the component in question, using the previous year's prices as weights; and then (b) chaining the sequence of annual movements to produce a continuous time series. This procedure is used at different levels within the accounts. For example, GDP is compiled by weighting together the individual industry value-added components to produce a Laspeyres volume index for each quarter, and then linking the resulting indexes to produce the GDP time series. Each industry component, such as transport and communication, is also a chain-volume series. At this lowest level, the 'elemental series' are not chained and are either single series in their own right or fixed-weight series comprising a number of components. Chaining is not adopted, either because relative price changes are not considered significant or (and this is the more likely scenario) the detailed information needed for annual weights is not available.

It is important to note that chain-volume series are not additive (ie the chain-volume series for an aggregate will not equal the sum of the values of its components). This is explained more fully in the report *Chain Volume Measures in National Accounts* (see below).

In most cases, the industry 'elemental series' estimates that make up the production-based GDP are calculated by extrapolating value added, using indicator series that represent the quantities of output produced. The technique known as double deflation, by which volume value added is calculated as the difference between volume outputs and inputs, is not widely used. It is used only for the agriculture and electricity industries on a quarterly basis, and for water transport and business services on an annual basis.

Further information on chain-volume series is contained in the report *Chain Volume Measures in National Accounts*, available from our website at www.stats.govt.nz. This report, published as a discussion document in 1998, contains a detailed discussion of the concepts and procedures used to compile chain-volume series.

Production-based measure the preferred series

Conceptually, both the production- and expenditure-based GDP series are the same. However, as each series uses independent data and estimation techniques, some differences between the alternative measures arise. The expenditure-based series has historically shown more quarterly volatility and is more likely to be subject to timing and valuation problems. For these reasons, the production-based measure is the preferred measure for quarter-on-quarter and annual changes.

Implicit price deflators

Table 5.1 contains implicit price deflators (IPDs) for expenditure on GDP and its components. IPDs provide a broad measure of price change for total economic activity and each of the expenditure components. They are calculated by dividing the seasonally adjusted current price quarterly series by the equivalent chain-volume series, and consequently provide an estimate of price change between the base period and any other period, using the quantity weights in the latter period. Because weights change from period to period, a change in an IPD between any two periods, neither of which is the base period, reflects changes in both actual prices and weights or compositional changes. Significant compositional changes may result in the IPDs being an unreliable estimate of price change. This problem is more likely to occur in the gross national expenditure (GNE) and expenditure on GDP aggregates, because both include the change in inventories item, which is subject to extreme compositional changes, including a change in sign.

Revisions policy

Revisions to the previously published series may be made each quarter. The frequency and cause of these revisions are as follows:

- **Quarterly:** additional data becoming available for the latest quarters, which is used to replace existing estimates; revisions to quarterly data (eg revisions to the Balance of Payments or Retail Trade Survey), which will be incorporated as soon as possible to maintain consistency between published macroeconomic statistics.
- **Annual:** introduction of annual data following the release of the latest annual national accounts each year; annual updating of the weights used to combine component series to totals and subsequent chaining (see below).
- **Irregular:** for example methodological changes. However, note that revisions of this nature are, as far as possible, incorporated to coincide with the annual cycle of revisions outlined above.

In addition, each of the above causes for revision, and/or the addition of a new point in the actual quarterly series, has the potential to alter seasonal factors and therefore may lead to a revision in the seasonally adjusted series.

Revisions resulting from chain-linking

One of the key benefits gained through adopting chain-volume measures in place of fixed-weight series is that the relative weights of the component series are more up to date. This reduces the likelihood of introducing biases in the volume measures, which would otherwise become progressively unrepresentative as relative prices change. However, the disadvantage is that the annual reweighting introduces another cause for revision.

Typically, new weights are introduced as soon as possible after the release of the current price annual national accounts (issued 20 July 2006). However, a potential issue was identified during the analysis of the effects of updating to year ended March 2003 weights. Hence it was decided to retain the weights for the year ended March 2002, and all subsequent quarters use these weights. Therefore, the chained series have a fixed-weight tail. When the weights are updated, this procedure results in revisions to all periods beyond the latest year for which detailed series are available (currently 2001/02).

It is expected that updated chaining weights will be introduced in the December 2006 quarter release in March 2007.

Revisions this quarter

Production measure:

- Since the June 2006 quarter release, all industries have been revised, due to the incorporation of current price annual industry value-added statistics for 2002 and 2003 (derived from balanced supply-use tables) and source data enhancements.
- Wholesale trade and food, beverage and tobacco manufacturing recorded the largest revisions resulting from the annual production account incorporation. This was influenced by additional and final information becoming available regarding the contribution of the Dairy Board to total wholesale trade in the year ended March 2002.
- Finance, insurance and business services has been revised, due to enhancements to the historic annual source data relating to property services. In addition, the latest Reserve Bank of New Zealand statistics have been used in the compilation of the value added for the finance and insurance industry.
- Construction has been revised, due to enhancements to the historic quarterly source data relating to non-building construction.
- Electricity, gas and water has been revised to account for amendments to the annual estimates of software own account capital formation.
- Mining value added has been revised, due to the incorporation of new annual mineral and coal production statistics from Crown Minerals.
- Agriculture value added has been revised, due to updated data sourced from the Ministry of Agriculture and Forestry, and other industry sources.
- Forestry and logging have been revised, due to updated information on roundwood removals and growth estimates from the Ministry of Agriculture and Forestry. New annual estimates for forestry prices and enhancements to the historic source data have also been incorporated.
- GST has been revised, due to gross fixed capital formation, household consumption expenditure and exports revisions.

Expenditure measure:

- Since the June 2006 quarter release, private household consumption expenditure, private non-profit organisations serving households consumption expenditure, gross fixed capital formation, change in inventories, central government final consumption expenditure, local government final consumption expenditure, exports and imports have been revised, due to the incorporation of current price expenditure data, as released in *National Accounts: Year ended March 2006* on 16 November 2006.

- Forestry inventories have been revised, due to the incorporation of updated annual volume and price data. Recent quarters have also been revised, due to updated roundwood removal data sourced from the Ministry of Agriculture and Forestry.
- Agriculture inventories have been revised, due to updated data sourced from the Ministry of Agriculture and Forestry, and other industry sources.
- Exports and imports series have been revised, due to previously provisional June 2006 quarter data becoming final and Balance of Payments revisions flowing through, as released in *Balance of Payments and International Investment Position: September 2006 quarter* on 20 December 2006.

Direct and indirect seasonal adjustment

The level at which a series is seasonally adjusted is important, since it has the potential to affect the quality of that seasonally adjusted series. The individual component series of the main economic variables can be seasonally adjusted and then summed to derive totals. This is called an indirect seasonal adjustment. Alternatively, the main economic variables can be seasonally adjusted at the total level, independently of the seasonal adjustment of their components. The adjustment of the total of an aggregate series is called a direct seasonal adjustment. The indirect approach has the advantage of retaining additivity, but this applies only to the current price series. Although the indirect approach conceptually also provides additivity for volume series, additivity is lost by chain-linking.

The direct approach will often give better results if the component series show similar seasonal patterns. At the most detailed level, the irregular factor may be large compared with the seasonal factor and therefore may make it difficult to perform a proper seasonal adjustment. In a small country such as New Zealand, irregular events can have a strong impact on particular data. However, if the component series show the same seasonal pattern, aggregation often reduces the impact of the irregular factors in the component series. This is particularly relevant for New Zealand, where many economic series are affected by seasonal fluctuations in the primary industries.

Statistics New Zealand has analysed both the direct and indirect approaches for the two quarterly GDP aggregates: production and expenditure on GDP. The direct approach has been chosen as the preferred method because the resulting series are smoother and more stable.

The residual between the seasonally adjusted components and the aggregates is referred to as the balancing item (see Tables 1.2 and 1.3). The balancing item will often show significant seasonal variations. This is to be expected, as it captures the undetected seasonality in the component series.

The level at which seasonal adjustment is applied to quarterly GDP series may differ from other Statistics NZ surveys (eg the Economic Survey of Manufacturing and the Wholesale Trade Survey). These may contribute to differences in the aggregate seasonally adjusted series.

Broad industry groups

In Tables 2.1 and 2.4, industry groups are combined to form the following broad groupings, based on the Australian and New Zealand Standard Industrial Classification (ANZSIC):

- primary industries (agriculture; fishing, forestry and mining)
- goods-producing industries (manufacturing; electricity, gas and water; construction)
- service industries (wholesale trade; retail, accommodation and restaurants; transport and communications; finance, insurance and business services; government administration and defence; personal and community services).

In addition to these industrial groupings there exists an 'unallocated' category, which includes unallocated taxes on production and imports (import duties, GST and taxes on capital transactions) and the nominal industry.

Final consumption expenditure

Private final consumption expenditure is the sum of household outlays on consumer goods and services, and the expenditure on non-capital items by private non-profit organisations serving households. General government final consumption expenditure includes both central and local government, as well as health and education.

Annual percentage changes

When using annual percentage changes, care should be taken to ensure that the measures used are correctly understood. Those in Tables 2.4, 2.5 and 3.3 compare the level of economic activity in the latest quarter with the level of activity in the corresponding quarter 12 months earlier.

Tables 2.7 and 3.5, on the other hand, display the percentage change in the level of GDP and expenditure on GDP, respectively, for the annual period each quarter, compared with the same period one year earlier. Annual measures are calculated by summing the series for each four-quarter period, dividing by the sum of the series of the preceding four quarters, and then expressing this as a percentage.

Real gross national disposable income

Gross national disposable income (GNDI) is the income received (less income payable) by New Zealand residents, from both domestic and overseas sources, after taking account of income redistribution by way of international transfers, or gross national income (GNI) plus international transfers.

Real gross national disposable income (RGNDI) measures the real purchasing power of national disposable income, taking into account changes in the terms of trade, and real gains from net investment and transfer income with the rest of the world. Effectively, it is a measure of the volume of goods and services New Zealand residents have command over.

RGNDI is calculated as follows:

chain-volume measure of **gross domestic product** (production-based measure)

plus a terms of trade effect (trading gain/loss)

equals real gross domestic income

plus real value of total net investment income

equals real gross national income

plus real value of total net transfers

equals real gross national disposable income

where the terms of trade effect is defined as:

current price exports deflated by an imports implicit price index

less chain-volume measure of exports

and the real value of total net investment income equals:
investment income credits
less investment income debits
all deflated by an imports implicit price index

and the real value of total net transfers equals:
transfers credits
less transfers debits
all deflated by an imports implicit price index.

A per capita measure is simply the series in question divided by the population of New Zealand. From the March 1991 quarter, the definition used is the 'estimated resident population of New Zealand'. This is defined as New Zealand residents currently in New Zealand plus those temporarily overseas. Overseas tourists visiting New Zealand are excluded from this measure. Prior to March 1991, the definition used is the 'de facto' population, which excludes New Zealand residents temporarily overseas and includes overseas tourists in New Zealand. Apart from the definitional change, there is also a slight discontinuity at this point, as the series from March 1991 onwards includes an allowance for the census undercount.

Sep	2.8	3.8	6.0	1.4	3.0	5.1	8.5	2.0

(1) Annual percentage changes are derived from the underlying current price and constant price data, rather than by summing the quarterly implicit price deflators.

(2) Percentage changes are calculated on rounded numbers.

Gross Domestic Product: September 2006 quarter

Table 6.1

(1) Expenditure measure.

(2) Production measure.

(3) For the definition of real gross national disposable income, refer to the Technical notes of this release.

(4) New Zealand usually resident population. For further details, refer to the Technical notes of this release.

(5) Quarterly time series for GDP in current prices, GDP in 1995/96 prices and real gross national disposable income are seasonally adjusted.

Gross Domestic Product: September 2006 quarter
