Accommodation Survey May 2005

Highlights

- **Total guest nights were at a similar level** in May 2005, compared with May 2004.
- **Six of the twelve regions recorded more guest nights** in May 2005 than in May 2004.
- **The trend level in total guest nights was 1 percent lower** in May 2005 than in May 2004.
- **Two of the five accommodation types recorded more guest nights** in May 2005 than in May 2004.

There is a companion Media Release published – [Accommodation Survey: May 2005](#).

Commentary

Total guest nights

Total guest nights in short-term commercial accommodation were 1.8 million in May 2005, a similar level compared with May 2004 and 4 percent higher than in May 2003.

Until recently, the trend in total guest nights had been increasing since June 1998. An apparent change in the direction of the trend since October 2004 should be treated with caution, as time series analysis suggests more data is required for the direction of the trend to be confirmed. In May 2005, the trend level in total guest nights was 1 percent lower than in May 2004, and 4 percent higher than in May 2003.

Comparison with short-term overseas visitor arrival statistics

The Hot Off The Press release External Migration: May 2005 shows that short-term overseas visitor arrivals in New Zealand for May 2005 were up 3,000 (2 percent) on May 2004. This follows a decrease of 9,600 (5 percent) in April 2005 compared with April 2004.

By contrast, the number of stay days for all visitor arrivals in May 2005 was down 4 percent from May 2004. This follows a decrease of 10 percent in April 2005 compared with April 2004.

The average length of stay for visitor arrivals in May 2005 was 17 days, compared with 18 days in May 2004. In April 2005, the average length of stay was 17 days, compared with 18 days in April 2004.

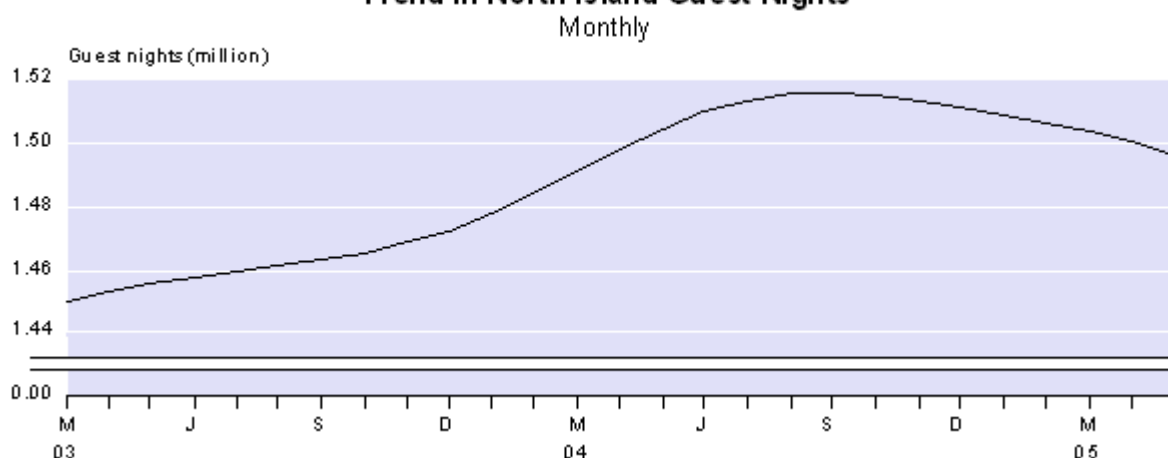

Guest nights by island

In May 2005, there were 1.1 million guest nights in the North Island and 0.7 million guest nights in the South Island. Both these figures were at a similar level to May 2004.

Until recently, the trend in North Island guest nights had been increasing since September 1998, while the trend in South Island guest nights had been increasing since August 1997. An apparent change in the direction of both these trend series in recent months should be treated with caution, as time series analysis suggests more data is required for the direction of these trend series to be confirmed.

In May 2005, the trend level in North Island guest nights was 1 percent lower than in May 2004, and 3 percent higher than in May 2003. The trend level in South Island guest nights was similar to May 2004, and was 8 percent higher than in May 2003.

Trend in North Island Guest Nights

Trend in South Island Guest Nights

Guest nights by region

Six of the 12 regions recorded more guest nights in May 2005 than in May 2004. Otago (up 14,000 or 7 percent) recorded the largest absolute increase in guest nights, followed by Wellington (up 9,000 or 6 percent).

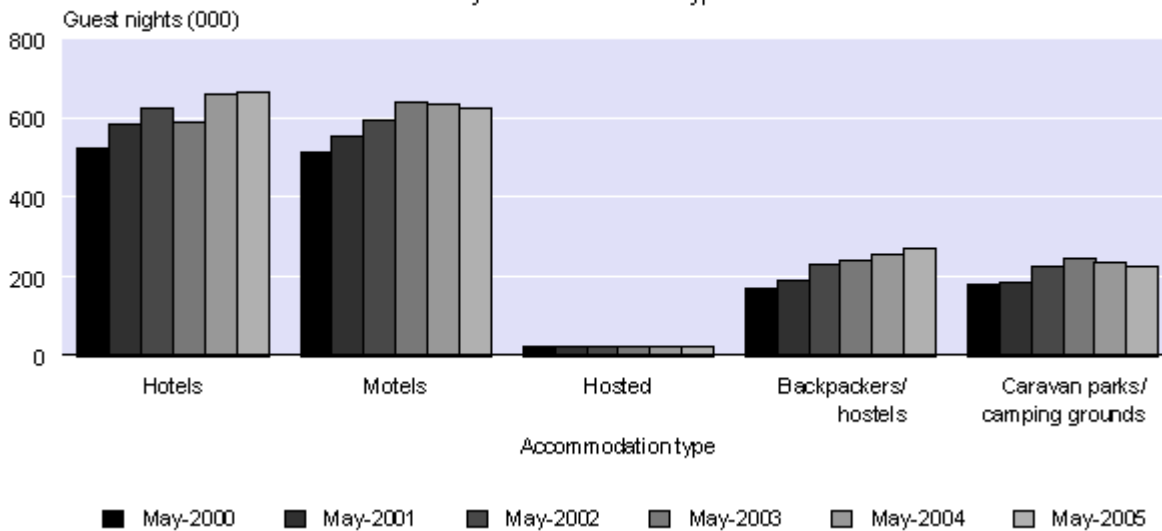

The Canterbury region (down 16,000 or 6 percent) recorded the largest absolute decrease in guest nights when comparing the two May months, followed by Auckland (down 12,000 or 3 percent).

Guest nights by accommodation type

Backpackers/hostels (up 14,000 or 5 percent) and hotels (up 6,000 or 1 percent) were the only two accommodation types to record more guest nights in May 2005 than in May 2004. This is the second consecutive month that these two were the only accommodation types to record increases in guest nights, compared to the same month of the previous year.

Hotels (37 percent) had the largest share of total guest nights in May 2005, followed by motels (35 percent) and backpackers/hostels (15 percent). Backpackers/hostels recorded their highest monthly share of total guest nights since the survey began in July 1996.

Guest Nights By accommodation type

The trend in hotel guest nights has been increasing since June 2003, after a period of decreases that began in November 2002. In May 2005, the trend level in hotel guest nights was 2 percent higher than in May 2004 and 10 percent higher than in May 2003.

Hotel Guest Nights Monthly

Occupancy rate

The May 2005 occupancy rate, excluding caravan parks/camping grounds, was 42 percent, compared with 44 percent in May 2004.

Accommodation capacity, excluding caravan parks/camping grounds, for May 2005 was 8 percent above the May 2004 level.

Hotels (47 percent) had the highest occupancy rate of all the accommodation types in May 2005, followed by motels (44 percent) and backpackers/hostels (35 percent).

In May 2005, the highest occupancy rate, excluding caravan parks/camping grounds, was recorded by the Wellington region (54 percent), followed by Auckland (52 percent) and Bay of Plenty (46 percent).

Non-response imputation

When respondents do not answer questions in the Accommodation Survey, Statistics New Zealand estimates the missing information based on data from similar establishments in the same and/or similar areas. For more information, please refer to the Technical Notes or contact Statistics New Zealand.

Response rates by accommodation type for May 2005

Accommodation type	Percentage of establishments responding to questions on guest nights, guest arrivals and stay unit nights	Percentage of the guest night estimate from establishments that responded to the question about guest nights
Hotels	83 percent	93 percent
Motels	80 percent	83 percent
Hosted	86 percent	84 percent
Backpackers/hostels	83 percent	86 percent
Caravan parks/camping grounds	83 percent	87 percent
Total New Zealand	82 percent	88 percent

Survey sponsorship

The Accommodation Survey is a monthly survey undertaken by Statistics New Zealand and sponsored by the Ministry of Tourism.

Technical notes

Population

The target population for this survey is all 'geographic units' (called 'establishments' in this publication) that are classified as short-term (less than one month) commercial accommodation providers operating in New Zealand. In terms of the Australian and New Zealand Standard Industrial Classification (ANZSIC), the target population is taken from class 5710 (accommodation), and the part of class 5720 (pubs, taverns and bars) that also provides accommodation.

The survey frame is all commercial accommodation-providing 'geographic units' belonging to an economically significant 'enterprise'. Economic significance is generally determined as being GST registered and having a turnover of at least \$30,000 per annum.

Survey errors

This survey aims for 100 percent coverage of the population (ie a full census). However, in practice, an overall response rate of between 76 and 80 percent is usually achieved. The remaining units are given imputed values based upon the characteristics of similar establishments in the same or similar regions. Imputation introduces unknown errors into the estimates, and this should be borne in mind by users of the data. The size of these unknown errors is difficult to quantify.

Other errors occur for reasons such as respondent error, frame quality and errors in processing. While every effort is made to minimise these types of error, they will still occur. It is not possible to quantify their effect.

Trend estimates

For any series, the survey estimates can be broken down into three components: trend, seasonal and irregular. While seasonally adjusted series have had the seasonal component removed, the trend series have had both the seasonal and the irregular components removed. Trend estimates reveal the underlying direction of movement in a series, and are likely to indicate turning points more accurately than seasonally adjusted estimates.

The accommodation trend series are calculated using the X-12-ARIMA seasonal adjustment package. They are based on optimal moving averages of the seasonally adjusted series, with an adjustment for outlying values. X-12-ARIMA is an updated version of X-11-ARIMA, developed by the US Bureau of the Census.

The trend estimates towards the end of the series incorporate new data as it becomes available, and can therefore change as more observations are added to the series. Revisions can be particularly large if an observation is treated as an outlier in one month, but is found to be part of the underlying trend as further observations are added to the series. All trend estimates are subject to revisions each month, but normally only the last two or three estimates are likely to be substantially altered.

Trend estimates versus month-on-month comparisons

Trend estimates reveal the underlying direction of the movement in a series. In contrast, comparisons between one month and the same month in the previous year(s) do not take account of data recorded in between these periods, and are subject to one-off fluctuations. Reasons for fluctuations include changes in the timing of holidays, international crises, and large sporting and cultural events.

Seasonally adjusted estimates

The X-12-ARIMA package has been used to produce the seasonally adjusted estimates referred to in the Commentary text. Seasonal adjustment aims to eliminate the impact of regular seasonal events. These may be due to climatic effects (such as more guests staying in camping grounds during the summer) or calendar effects (such as holidays). This makes the data for adjacent months more comparable. All seasonally adjusted figures are subject to revision each month.

Further information about [seasonal adjustment](#) is available on the Statistics New Zealand website.

Classification of accommodation type

The predominant capacity provided determines the accommodation type. For instance, if a business provides both motel and camping ground accommodation, but the majority of its stay units are motel rooms, then it would be classified as a motel. The classification system used is the New Zealand Accommodation Classification, broadly defined below:

- Hotels: includes both hotels and resorts
- Motels: includes motor inns, apartments and motels
- Hosted: includes private hotels, guest houses, bed and breakfasts, and holiday farm (farmstay) accommodation
- Backpackers/hostels
- Caravan parks/camping grounds.

Further information on the classification system is available on request.

Classification of residence of guest

Every third month (January, April, July and October), the survey asks all respondents to classify their guests as coming from the following regions:

Domestic

Auckland
Wellington
Rest of North Island
Canterbury
Otago
Rest of South Island
Don't know

International

Australia
Japan
Korea
Other Asia
UK and Ireland
Germany
Other Europe
North America
Other
Don't know

Other definitions

Business Frame

A register (maintained by Statistics New Zealand) of all economically significant businesses operating in New Zealand from which the survey population is drawn.

Establishment

The smallest statistical unit operating within a single physical location and owned by a single enterprise. The term is used to represent what is usually called the 'geographic unit' in other Statistics New Zealand publications.

Guest night

A guest night is equivalent to one guest spending one night at an establishment. For example, a motel with 15 guests spending two nights would report provision of 30 guest nights of accommodation.

Stay unit

The term used to describe the unit of accommodation that is available to be charged out to guests (eg a powered site, a bed in a bunkroom, a motel unit).

Stay unit night (capacity)

This is the basic measure of an establishment's accommodation capacity. It is defined as one stay unit multiplied by one night. For example, 10 units in a motel available for guest use (whether occupied or not) for the full 31 days in July would have an accommodation capacity of 310 stay unit nights.

Occupancy rate

This derived variable is calculated by dividing stay unit nights occupied by stay unit nights available. In the case of the motel above, if six of its 10 units were occupied every night in July, it would have $6 \times 31 = 186$ stay unit nights occupied, and its occupancy rate would be 60 percent.

Average length of stay

This derived variable is calculated by dividing total guest nights by total guest first nights.

Tables

The following tables can be downloaded from the Statistics New Zealand website in Excel 97 format. If you do not have access to Excel 97 or higher, you may use the [Excel file viewer](#) to view, print and export the contents of the file.

List of tables

1. Establishments, capacity, guest nights, occupancy rate and average stay, by accommodation type
2. Occupancy rate excluding caravan parks/camping grounds, by region
3. Total guest nights
4. Seasonally adjusted and trend guest nights, by accommodation type
5. North Island guest nights
6. South Island guest nights

Accommodation pivot tables

The Accommodation Pivot Tables provide more detailed information, breaking the survey variables down by regional tourism organisations areas and territorial authority areas.

Regional Tourism Organisation (RTO) Area by Accommodation Type (Type)

Contains number of establishments, capacity, occupancy rates, guest nights, guest arrivals, length of stay and some ratios of these variables.

The graph on the first worksheet will change to display the RTO and Type you select on the second worksheet. When printing the graph, select a cell rather than the graph so the heading will print.

Total Accommodation by Territorial Authority (TA)

Contains number of establishments, capacity, occupancy rates, guest nights, guest arrivals, length of stay and some ratios of these variables.

Origin of Guests and Employment Information by Regional Tourism Organisation (RTO)

Contains domestic and international guest night variables and employees.

Printing a selection of data in a spreadsheet

If you only want to print out some of the information in a spreadsheet, either select the pages you want in the print box, or hide the data you don't want to print by highlighting the columns or rows of data you don't want, then right click the mouse and select 'Hide'.
